Enoda Cellworks
San Francisco Bay Area, CA

Enoda is a team of **engineers, synthetic immunologists, and tool builders** dedicated to developing the next-generation of cell therapies. To achieve this future, we are building a team from all walks of science to incorporate many perspectives into designing cells. If you are excited to maximize the impact cell therapies have on treating disease, we would love to hear from you!

Contact us at [hiring@enoda.bio](mailto: hiring@enoda.bio) and send us your CV. We are excited to chat with people of all levels and backgrounds.

Enoda's Vision

Synthetic biology has transformed cells into medicine, harnessing their native potential to target cancers, clear viral infections, repair wounds, overcome autoimmunity, reverse aging, and beyond. At Enoda, we believe that the cells that make up our bodies hold the key to cure everything that afflicts us. Our mission is to chart the phenotypic landscape of our cells, discovering ways to transform them into potent disease fighting machines. The development of cell therapies has been dominated by relying on what is currently known to double down on specific receptors, cell types, and indications without regard for finding the optimal mix. Enoda is a team of synthetic biologists looking to reverse this paradigm by combining our novel proteins to exploit untapped pathways with high-throughput screening and systems immunology to engineer the right cell type with the right tools for the right indication. We are building towards a future where every facet of cells are precisely engineered to maximize the therapeutic potential.
